2011 WSU Soft White Winter Wheat Trial Summary

Precipitation Zone 12-16” – Preliminary Data

1. Soft white winter wheat grain yield across five locations and 60 entries in the 12-16” precipitation zone averaged 109 bushels/acre and is 7 bushels/acre higher than the 2010 average of 102 bushels/acre and 26 bushels/acre higher than the 2009 average of 83 bushels/acre. The CV for the average data was 10, similar to the 2010 CV. In general the trials had good fall establishment.
2. Yields among entries averaged across locations ranged from 84 to 129 bushels/acre and reflected the favorable precipitation and temperature for most of the growing season. Xerpha was the highest yielding named variety averaged across locations. Average yield values within the 10% LSD range (9 bushels/acre) of the highest yield are shown in bold and this included 8 of the 60 entries. Stripe rust influenced yields in some locations and changed yield rankings due to susceptibility. Fungicide applications and yield impacts in percent for these locations were: no fungicide and 10% impact at Almira, none and 10% at Dusty, two and 10% at Lamont, two and no impact at Anatone, and two and no impact at Creston.
3. Test weight averaged 60.5 lb/bu across locations and entries and was higher than last year’s 58.0 lb/bu average. Grain protein averaged 10.4% and was lower than last year’s 11.1% protein value.
