Lind Hard Spring Wheat - Preliminary Data

1. Grain yield in the 2012 Lind hard spring wheat trial averaged 26 bushels/acre, 3 bushel/acre lower than the 5-year average. The Lind nursery was located on the WSU Lind Dryland Experiment Station three miles NE of Lind, WA. This nursery was conducted in cooperation with the WSU spring wheat breeding program.
2. This nursery was seeded on 9 March, 2012 following fallow. Seed was placed at a 60#/acre seeding rate using a double-disk plot drill set on 6-inch spacing. Base fertilizer was 50#N/acre and soil test analysis showed ample N available to meet the hard protein target at projected yield levels. Spring seeding and establishment conditions were good.
3. Yields ranged from 21 bu/acre to 32 bu/acre. Yield values within the LSD range of the highest yield are shown in bold and 4 of the 30 entries are in this group. The hard white variety 'Otis' was the highest yielding in 2012 and 'Kelse', 'Jefferson' and 'WB-Fusion' were the highest yielding over 5 years at this location. No fungicides were applied nor stripe rust impact observed in this trial.
4. Test weights were good with an average of 60.9 lbs./bu and ranged from 59.0 to 62.7 lbs./bu. Grain protein averaged 16.8% with a range of 15.4 to 18.0%. The average plant height was 26 inches with no lodging.
