**Project #:** 139311 **Progress Report:** Year 2 of 3

**Title:** EVALUATION OF BARLEY VARIETIES **Researcher:** Clark Neely, Variety Testing Program Lead

## **EXECUTIVE SUMMARY:**

The WSU Extension Cereal Variety Testing Program (VTP) continues to conduct spring barley variety trials at 12 locations throughout Eastern Washington. Newly added in 2023 was the addition of a winter barley trial at eight high rainfall locations with six entries total. This increased the total number of barley plots managed by the program by 17%. Data were posted in a timely manner following harvest and distributed via list serve, website, popular press articles, and in-person field days and grower meetings.

#### **INTRODUCTION:**

The primary goal of the WSU Extension Cereal Variety Testing Program (VTP) is to provide growers, the agribusiness industry, university researchers, and other interested clientele with comprehensive, objective, and independent information on the adaptation and performance of barley cultivars across the intermediate and high rainfall dryland production regions of eastern Washington where barley is grown. Major decisions or changes made by the program are run by an advisory committee composed of representatives from the WGC, WAWG, seed industry, and WSU Extension. The committee meets twice a year and provides valuable feedback on how the program can best support industry and grower needs.

## **APPROACH:**

The VTP planted 12 spring barley and 8 winter barley variety trials in 2023. This is the first year the program conducted winter barley variety trials at the request of the WGC and WSU barley breeder. While the trial was small in 2023 (just four experimental lines and two commercial checks), two more commercial varieties were added for the 2024 season with more interest already expressed by private companies for the upcoming 2025 season. While all trials were harvested, data from Pullman spring and Dayton and St. John winter trials were not published due to high variability or lack of significant differences within each trial. All data is posted on our website and email notifications were sent out via the 'prelimdata' list serve when data were available. In the past year, the number of members on this list has increased 7% to 424 subscribers. The final technical report was posted on our website (http://smallgrains.wsu.edu/variety) at the end of December 2023.

#### **RESULTS:**

Barley varieties were covered at seven field days with a total of 175 attendees. Dr. Neely led efforts to revive the Spillman Farm Field Day in 2022, where 82 attendees listened to numerous researchers, including Dr. Bob Brueggeman who shared his breeding program updates and attendees heard about the newest spring barley varieties being tested in the VTP. Through conversations with the Whitman County Association Wheat Growers the plan will be to alternate years for the Spillman Farm Field Day.

Spring barley entries were also submitted to University of Idaho for screening of Hessian fly resistance, which will be a new addition to the list of variety characteristics. In 2024, we plan to provide seed to Dr. Kim Garland-Campbell with USDA-ARS for cold tolerance screenings of winter barley entries. Seed was provided in 2023 for cold tolerance screening, but was used to fine tune growth chamber conditions to better detect varietal differences. Generated ratings will be uploaded on to the variety selection tool once data is compiled. Select harvested sample are also sent to the WSU Barley Breeding Program for micro-malting analysis

# **IMPACT:**

The economic value (impact) of the WSU VTP is measured by providing information to growers and seed industry personnel leading to variety selections that maximize profitability and minimize risk. Choosing an appropriate barley variety to plant is one of the easiest ways that a grower can increase production and decrease costs (through decreased inputs). In 2023, 95,000 acres of spring barley were planted. When comparing the yield from the top four varieties in each trial to the trial average, there is approximately a 251 lb/a yield advantage. When multiplied across planted acres and using an average sales price of \$321/ton, the VTP had the potential to generate an additional \$3.8 million dollars in 2023 alone as shown in the table below. The VTP strives to disseminate information to growers as widely as possible. Both the variety testing website and the variety selection tool average over 8,000 page views each on an annual basis. Typically, well over a hundred contacts are also made through field days and grower meetings each year. While yield is important, there are multiple traits that growers look for in a variety, which vary in importance from region to region. The VTP publishes data on test weight, grain protein, plump seed, plant height, maturity, Hessian fly resistance and stripe rust resistance. An additional impact of the VTP comes through the evaluation of breeding lines, providing valuable information to aid breeders in variety release decisions, leading to new and improved barley varieties available to growers in Washington.

Year	Harvested Barley Acres	Average Yield Gain for Top Four Varieties in Trials	Average Price of Feed Barley	Additional Income Generated
	# acres	lb/acre	\$/ton	\$
2022	71,000	570	\$243	\$4,917,105
2023	95,000	251	\$321	\$3,827,123
Total				\$8,744,228
