

# 2021–2022 COST ESTIMATES OF ESTABLISHING, PRODUCING, AND PACKING CHELAN SWEET CHERRIES IN WASHINGTON STATE

## Preface

The results presented in this WSU publication serve as a general guide for evaluating the feasibility of producing Chelan sweet cherries in Washington State in 2021–2022. This publication is not intended to be a definitive guide to production practices, but it is intended to be helpful in estimating the physical and financial requirements of comparable plantings. Specific budget assumptions were adopted for this study, but these assumptions may not represent the conditions in all production and marketing situations since production costs and returns vary across orchard operations, depending on the following factors:

- Capital, labor, and natural resources
- Crop yields
- Type and size of machinery, irrigation, and frost control systems
- Input prices
- Cultural practices
- Sweet cherry prices
- Orchard size
- Management skills

Cost estimations in the enterprise budget also vary depending on the budget's intended use. To avoid drawing unwarranted conclusions for any particular orchard, readers must closely examine the assumptions made in this guide and then adjust the costs, returns, or both as appropriate for their own orchard operation.

## Chelan Sweet Cherry Production in Washington State

Washington State is the number one producer of sweet cherries in the United States. In 2019, the gross value of sweet cherries

was about \$394 million, ranking it eighth in terms of overall value of agricultural commodities produced in the state (WSDA 2021).

The top three sweet cherry varieties in Washington State, in terms of bearing acreage, are Bing, Sweetheart, and Chelan. The bearing acreage of Chelan is about 10% of the state total for sweet cherries in 2017, as compared to the shares of Bing and Sweetheart at 53% and 11%, respectively. The bearing acres of Chelan sweet cherries were 4,193 acres in 2017, distributed among four production regions: 36.4% in the Yakima Valley, 6.1% in Wenatchee, 27% in the Columbia Basin, and 30.5% in other areas (USDA NASS 2017). The free on board (FOB) price of Chelan in 2021 was \$2.71/lb. Between 2017 and 2021, the minimum and maximum prices of Sweetheart were \$2.27/lb and \$2.80/lb, respectively. The five-year average FOB price was \$2.62/lb, which is 3% lower than in 2021 (WSTFA 2021).

## Study Objectives

The primary use of this report is in identifying inputs, costs, and yields considered typical of well-managed Chelan sweet cherry orchards.

This publication is designed to enable growers to estimate (1) the costs of equipment, materials, supplies, and labor required to establish and produce a Chelan sweet cherry orchard, including packing costs, and (2) the ranges of price and yield at which Chelan sweet cherry production would be a profitable enterprise.

## Information Sources

The data used in this study were collected from information shared by a group of experienced Chelan cherry growers in Washington. Their production practices and input requirements form the baseline assumptions that were used to develop the enterprise budget. Additionally, the data represent what these owner-operators anticipate would occur over an orchard's life, if no unforeseen failures occur. Given that many factors affect

WASHINGTON STATE UNIVERSITY  
**EXTENSION**

production costs, packout, and returns, individual growers can use the Excel Workbook (available at the [School of Economic Sciences Crop Enterprise Budgets](#)) to make necessary modifications and estimate their own costs and returns.

## Budget Assumptions

1. The area of the total farm operation is 300 acres. Bearing acres include 225 acres of apples (75% of total area), 48 acres of sweet cherries (16%), and 27 acres of pears (9%).
2. This budget is based on a 13-acre Chelan sweet cherry block within a 300-acre orchard. It is assumed that 1 acre of this block is dedicated to roads, pond, loading area, buildings, etc., rather than to fruit production. Therefore, the total productive area for this block is 12 acres. Table 1 shows the assumed Chelan block specifications, which are generally accepted among all growers interviewed.
3. The total value of bare agricultural land (including water rights) is \$18,000 per acre with annual property taxes of \$107 per acre.
4. The irrigation system consists of dual system drip irrigation and micro under-tree sprinkler system. Water is provided through a public irrigation district.
5. This study assumes that the pond, mainline, and pump already exist and that only the irrigation system and wind machine are newly installed.
6. Cultural practices and harvest activities are done by using a combination of manual labor, ladders, and labor-enhancing equipment. The hourly manual labor rate for 2021 is calculated using the Washington adverse wage rate for 2021 at \$16.34/hour. In this analysis, we add 25% to reflect medical leave and all administrative costs for H2A employees, including housing, amounting to \$20.43/hour. Activities such as chemical application, irrigation, and frost protection cost \$21.68/hour (i.e., base of \$17.34/hour plus 25%). Harvest labor rates follow the Department of Labor rates, plus 4% to account for mandated paid rest breaks. These labor rates are assumed the same for all years of production.
7. The FOB price or gross return for Chelan sweet cherries is \$2.55/lb; that is, the return before all expenses, including packing charges, are subtracted.

8. Average packout for Chelan sweet cherries is 80%. Packout rate is determined by the amount of Chelan cherries that can be packed for the primary (fresh) market divided by the amount of Chelan cherries harvested.
9. Management is valued at \$450 per acre.
10. Interest on investment represents a 5% opportunity cost to the enterprise. These are forgone earnings for investing money in orchard, equipment, and buildings rather than in an alternative activity. This also represents interest on funds borrowed to finance orchard, equipment, and building purchases.

## Summary of Study Results

The estimated annual cost and returns for a 12-acre block of Chelan sweet cherries in Washington are shown in Table 2. Production costs are classified into variable costs and fixed costs. Variable costs comprise orchard operations, harvest activities, materials, maintenance and repairs, and packing costs. Fixed costs are incurred whether or not sweet cherries are produced. These costs will generally be calculated for the whole farm enterprise and allocated across each unit of production. The fixed costs include depreciation on capital, interest, taxes, insurance, management, and amortized establishment costs. Management is treated as a fixed cost rather than a variable cost because, like land, management has been committed to the production cycle of the crop.

The study assumed that a Chelan sweet cherry orchard could achieve full production in the sixth year. Based on the above assumptions, the total production costs for Chelan sweet cherries during full production are estimated at \$27,704 per acre. The net returns during full production are about \$9,160 per acre. Table 3 shows the sensitivity of net returns to different combinations of price and yields. For this analysis, the FOB prices considered are \$2.25–\$2.85 per pound, and the net yields are 4,800–20,800 pounds per acre, given an 80% packout. A gross yield-price combination of 14,000 lb/acre or greater and \$2.25/lb or higher would result in positive net returns for the owner-operator, based on the study's production and cost assumptions.

Table 1. Chelan sweet cherry block specifications.

Architecture	Central leader, three-dimensional
In-row Spacing	6 feet
Between-row Spacing	12 feet
Rootstock	Gisela G12 rootstock
Productive Block Size	12 acres
Life of Planting	25 years
Tree Density	605 trees per acre
Trellis System	Vertical trellis

<b>Accumulated Establishment Costs</b>	16,920.59	23,699.30	26,569.12	26,024.15	21,317.12	

<sup>a</sup> The full production year is representative of all the remaining years the orchard is in full production (Year 6 to Year 25).

<sup>b</sup> Estimated net production considers an average packout of 80%.

<sup>c</sup> Price reflects the FOB price or gross return (i.e., the return before all expenses, including packing charges, are subtracted).

<sup>d</sup> Hand labor rate is \$20.43/hour and includes all applicable additional expenses.

<sup>e</sup> Tractor/machinery, irrigation, and frost protection labor rate is \$21.68/hour and includes all applicable additional expenses.

<sup>f</sup> Includes materials and labor.

<sup>g</sup> Includes the cost of monitoring each tree for symptoms and cost of testing plant sample for little cherry virus and western X.

<sup>h</sup> General farm labor rate is a lump sum per acre and is applied to miscellaneous/all other labor. Rate includes applicable additional expenses.

<sup>i</sup> Cost of drying cherries (three weeks before harvest and one week during harvest) when cherries start to turn color.

<sup>j</sup> Picking rate = \$0.20/lb. Checkers & tractor driver rate = \$0.05/lb. Hauling rate = \$0.02/lb.

<sup>k</sup> Warehouse packing charge = \$0.60/lb.

<sup>l</sup> Captures indirect costs of operations in the orchard that fluctuate with the level of production but are not accounted for by the variable costs already identified. Also captures unforeseeable expenses.

<sup>m</sup> Interest expense on full year during establishment years and for three-quarters of a year during full production.

<sup>n</sup> Land cost is approximated by using the 5% interest rate multiplied by the land value of \$18,000 per acre.

<sup>o</sup> Represents the costs incurred during the establishment years (minus revenue during those years) that must be recaptured during the full production years. It is calculated as: accumulated establishment costs in Year 5 amortized at 5% for 20 years.

Table 4 shows the break-even return given different yield levels during full production. As of 2021, the break-even return for Chelan cherries is estimated at \$1.91 per pound for a gross production of 18,000 pounds per acre and 80% packout.

Most of the budget values given in Table 2 are based on more comprehensive underlying cost data, which are shown in Tables 5 through 8. Table 5 presents the annual capital requirements for a 12-acre Chelan block. Table 6 specifies the machinery and building requirements for the 300-acre multi-crop cultivar orchard. Interest costs and depreciation are listed in Tables 7 and 8, respectively. Interest costs represent required return on investments. They can be actual interest payments on

funds borrowed to finance farm operations and physical capital investments, an opportunity cost (a return that would have been received if the investment had been in an alternative activity), or a combination of the two. All interest and amortization costs assume a 5% interest rate. The amortized establishment costs assume a total productive life of 25 years, which includes 5 years of establishment and 20 years of full production. The amortized establishment costs must be recaptured during the full production years in order for an enterprise to be profitable. Depreciation costs are annual, noncash expenses that are calculated over the asset's useful life. These expenses represent the loss in an asset's value due to use, age, and obsolescence.

The key results of the Chelan enterprise budget are formed by production-related assumptions established for the study. Production costs and returns for individual owner-operators may differ; thus, the results cannot be generalized to represent the population of apple operations in Washington State. An interactive Excel Workbook, described below, is provided to enable individual owner-operators to estimate their returns based on the costs of their production.

## 2022 Updates

Key cost centers have increased as of 2022, compared to 2021. Increased costs mainly include hourly labor, propane and fuel, and fertilizer. This increase, coupled with weather events leading to a small crop size compared to previous years, necessitated the inclusion of these latest data in this publication.

For labor, the manual labor rate is calculated using the Washington adverse wage rate for 2022 at \$21.76/hour (that is, a base of 17.41/hour plus 25% to reflect medical leave and all administrative costs for H2A employees, including housing). The labor rate for activities such as chemical application, irrigation, and frost protection is \$23.01/hour (i.e., base of \$18.41/hour plus 25%). Harvest labor rates follow the Department of Labor rates, plus 4% to account for mandated paid rest breaks.

Other calculation assumptions related to costs and returns for 2022 are the same as for the 2021 study.

Table 9 shows the total production costs for Chelan sweet cherries during full production, estimated at \$28,233 per acre. The net returns during full production are about \$8,631 per acre. Table 10 shows the sensitivity of net returns to different combinations of price and yield. A gross yield-price combination of 14,000 lb/acre or greater and \$2.25/lb or higher would result in positive net returns for the owner-operator, based on the study's production and cost assumptions. The break-even price for Chelan cherries, as of 2022, is estimated at \$2.15/lb, assuming 80% packout and a gross production of 14,000 lb/acre (Table 11).

## Excel Workbook

An Excel spreadsheet version of the 2021 enterprise budget (Table 2) as well as associated data underlying the per-acre cost calculations (Tables 5 through 8 and Appendices 1 through 6 for establishment costs, full production costs, calculation of salvage value and depreciation costs, amortization calculator, all production-related data, and net present value and payback period calculators for the Chelan sweet cherry orchard investment) are available at the [WSU School of Economic Sciences Extension website](#). The spreadsheets with updates for labor, fertilizer, propane fuel, and fertilizer costs as of 2022 are also available at this website.

Owner-operators can modify select values and thus use the Excel Workbook to evaluate their own production costs and returns.

Table 3. Estimated net returns (\$) per acre at various prices and yields of Chelan during full production<sup>a</sup>.

Gross Yield (lb/acre)	Net Yield (lb/acre) <sup>b</sup>	FOB Price (\$/lb) <sup>c</sup>				
		\$2.25	\$2.40	\$2.55	\$2.70	\$2.85
6,000	4,800	(\$4,895)	(\$4,175)	(\$3,455)	(\$2,735)	(\$2,015)
10,000	8,000	(\$1,650)	(\$450)	\$750	\$1,950	\$3,150
14,000	11,200	\$1,595	\$3,275	\$4,955	\$6,635	\$8,315
18,000	14,400	\$4,840	\$7,000	\$9,160	\$11,320	\$13,480
22,000	17,600	\$8,084	\$10,724	\$13,364	\$16,004	\$18,644
26,000	20,800	\$11,329	\$14,449	\$17,569	\$20,689	\$23,809
Overhead Cost	5%					
Interest Cost	5%					

Note: Shaded area denotes positive net returns based on the combination of net yield and price.

<sup>a</sup> Includes cull value. Culls comprise what remains after packing (20% of gross yield).

<sup>b</sup> Takes into account an average packout equivalent to 80%.

<sup>c</sup> Price represents the FOB price or gross return (the return before total production costs, including packing charges, are subtracted).

Table 4. Break-even return (\$/lb) of Chelan sweet cherries given different crop yield levels during full production.

Gross Yield (lb/acre)	Net Yield (lb/acre) <sup>a</sup>	Break-even Return (\$/lb) <sup>b,c</sup>
6,000	4,800	3.27
8,000	6,400	2.76
10,000	8,000	2.46
14,000	11,200	2.11
18,000	14,400	1.91

<b>Gross Yield (lb/acre)</b>	<b>Net Yield (lb/acre)<sup>a</sup></b>	<b>Break-even Return (\$/lb)<sup>b,c</sup></b>
22,000	17,600	1.79
26,000	20,800	1.71

<sup>a</sup> Accounts for an average packout of 80%.

<sup>b</sup> Includes cull value. Culls comprise what remains after packing (i.e., 20% of gross yield).

<sup>c</sup> This is the *total cost break-even return*. Only when this break-even return is received can the grower recover all out-of-pocket expenses plus opportunity costs. It is calculated as: *total cost minus the gross return of culls, then divided by net yield of fresh Chelan cherries*. The calculation considers the gross yield and packout, and their associated harvest and packaging costs. For instance, if the gross yield during full production is 6,000 lb/acre, the net yield is 4,800 lb/acre given an 80% packout. Given this net yield, a return of approximately \$3.27/lb must be received for the Chelan sweet cherry enterprise to break even.

Trellis	54,000	0	12	1,350	112.50
Wind Machine <sup>c</sup>	43,367	0	12	1,084	90.35
<i>Interest Rate</i>	<i>5.0%</i>				

<sup>a</sup> Not applied to land because land is not a depreciable asset.

<sup>b</sup> Interest cost is calculated as: (Total Purchase Price + Salvage Value)/2 × Interest Rate. For land, the calculation is: Total Purchase Price × Interest Rate, because there is no salvage value for land.

<sup>c</sup> The irrigation system, mainline and pump, pond, trellis system, and wind machine are used for the direct production of the fruit. Hence, their respective interest costs are divided by the production area (12 acres) to get the interest cost per acre.

<sup>d</sup> Total area of the farm operation is 300 acres, and the machinery, equipment, and building are used in the entire farm. Thus, the corresponding interest costs are divided by the total area (300 acres) to derive the interest cost per acre.

<sup>e</sup> See the Excel Workbook (Appendix 3) for a detailed calculation of the salvage value of the machinery, equipment, and building.

Table 8. Annual depreciation costs per acre for a 12-acre Chelan sweet cherry block (\$/acre).

	<b>Total Purchase Price (\$)</b>	<b>Number of Acres</b>	<b>Total Value per Acre (\$)</b>	<b>Years of Useful Life</b>	<b>Depreciation Cost per Acre (\$/yr)<sup>a</sup></b>
Irrigation System	46,200	12	3,850.00	30	128.33
Mainline & Pump	0	12	0.00	30	0.00
Pond	0	12	0.00	50	0.00
Trellis	54,000	12	4,500.00	20	225.00
Wind Machine	43,367	12	3,613.88	30	120.46
Machinery, Equipment & Building <sup>b</sup>					261.92

<sup>a</sup> The depreciation cost is calculated as straight-line depreciation: (Total Purchase Price – Salvage Value)/Years of Use.

<sup>b</sup> See the Excel Workbook (Appendix 3) for a calculation of the depreciation cost of the machinery, equipment, and building.

Table 9. 2022 cost and returns per acre of establishing, producing, and packing Chelan sweet cherries on a 12-acre block.

<b>ESTIMATED NET RETURNS</b>	(17,162.34)	(7,097.81)	(3,244.90)	106.97	4,225.07	8,631.24
<b>Accumulated Establishment Costs</b>	17,162.34	24,260.15	27,505.05	27,398.08	23,173.01	

<sup>a</sup> The full production year is representative of all the remaining years the orchard is in full production (Year 6 to Year 25).

<sup>b</sup> Estimated net production considers an average packout of 80%.

<sup>c</sup> Price reflects the FOB price or gross return (i.e., the return before all expenses, including packing charges, are subtracted).

<sup>d</sup> Hand labor rate is \$21.76/hour and includes all applicable additional expenses.

<sup>e</sup> Tractor/machinery, irrigation, and frost protection labor rate is \$23.01/hour and includes all applicable additional expenses.

<sup>f</sup> Includes materials and labor.

<sup>g</sup> Includes the cost of monitoring each tree for symptoms and cost of testing plant sample for little cherry virus and western X.

<sup>h</sup> General farm labor rate is a lump sum per acre and is applied to miscellaneous/all other labor. Rate includes applicable additional expenses.

<sup>i</sup> Cost of drying cherries (three weeks before harvest and one week during harvest) when cherries start to turn color.

<sup>j</sup> Picking rate = \$0.25/lb. Checkers and tractor driver rate = \$0.05/lb. Hauling rate = \$0.02/lb.

<sup>k</sup> Warehouse packing charge = \$0.60/lb.

<sup>l</sup> Captures indirect costs of operations in the orchard that fluctuate with the level of production but are not accounted for by the variable costs already identified. Also captures unforeseeable expenses.

<sup>m</sup> Interest expense on full year during establishment years and for three-quarters of a year during full production.

<sup>n</sup> Land cost is approximated by using the 5% interest rate multiplied by the land value of \$18,000 per acre.

<sup>o</sup> Represents the costs incurred during the establishment years (minus revenue during those years) that must be recaptured during the full production years. It is calculated as: accumulated establishment costs in Year 5 amortized at 5% for 20 years.

Table 10. 2022 estimated net returns (\$), per acre, at various prices and yields of Chelan during full production<sup>a</sup>.

Gross Yield (lb/acre)	Net Yield (lb/acre) <sup>b</sup>	FOB Price (\$/lb) <sup>c</sup>				
		\$2.25	\$2.40	\$2.55	\$2.70	\$2.85
6,000	4,800	(5,423)	(4,703)	(3,983)	(3,263)	(2,543)
10,000	8,000	(2,179)	(979)	221	1,421	2,621
14,000	11,200	1,066	2,746	4,426	6,106	7,786
18,000	14,400	4,311	6,471	8,631	10,791	12,951
22,000	17,600	7,556	10,196	12,836	15,476	18,116
26,000	20,800	10,801	13,921	17,041	20,161	23,281
Overhead cost	5%					
Interest cost	5%					

Note: Shaded area denotes positive net returns based on the combination of net yield and price.

<sup>a</sup> Includes cull value. Culls comprise what remains after packing (20% of gross yield).

<sup>b</sup> Takes into account an average packout equivalent to 80%.

<sup>c</sup> Price represents the FOB price or gross return (the return before total production costs, including packing charges, are subtracted).

Table 11. 2022 break-even return (\$/lb) of Chelan sweet cherries given different crop yield levels during full production.

Gross Yield (lb/acre)	Net Yield (lb/acre) <sup>a</sup>	Break-even Return (\$/lb) <sup>b,c</sup>
6,000	4,800	3.38
8,000	6,400	2.84
10,000	8,000	2.52
14,000	11,200	2.15
18,000	14,400	1.95

Gross Yield (lb/acre)	Net Yield (lb/acre) <sup>a</sup>	Break-even Return (\$/lb) <sup>b,c</sup>
22,000	17,600	1.82
26,000	20,800	1.73

<sup>a</sup> Accounts for an average packout of 80%.

<sup>b</sup> Includes cull value. Culls comprise what remains after packing (i.e., 20% of gross yield).

<sup>c</sup> This is the *total cost break-even return*. Only when this break-even return is received can the grower recover all out-of-pocket expenses plus opportunity costs. It is calculated as: *total cost minus the gross return of culls, then divided by net yield of fresh Chelan cherries*. The calculation considers the gross yield and packout and their associated harvest and packaging costs. For instance, if the gross yield during full production is 6,000 lb/acre, then the net yield is 4,800 lb/acre given an 80% packout. Given this net yield, a return of approximately \$3.38/lb must be received for the Chelan sweet cherry enterprise to break even.

## Acknowledgements

The authors acknowledge the information provided by a group of anonymous Chelan sweet cherry orchard and packinghouse owners-operators, pesticide consultants, nursery representatives, financial institutions' representatives, and WSU Extension educators. This work was supported by the USDA National Institute of Food and Agriculture, Specialty Crop Research Initiative project, Moving from Crisis Response to Long-Term Integrated Management of SWD: A Keystone Pest of Fruit Crops in the United States (award no. 2020-51181-32140).
