

Status of the ClearSky Online Gaming Tool

Joe Vaughan, Brian Lamb and Jen Hinds
Laboratory For Atmospheric Research

*2011 NW-AIRQUEST Annual Meeting
Pullman, WA -- June 2, 2011*

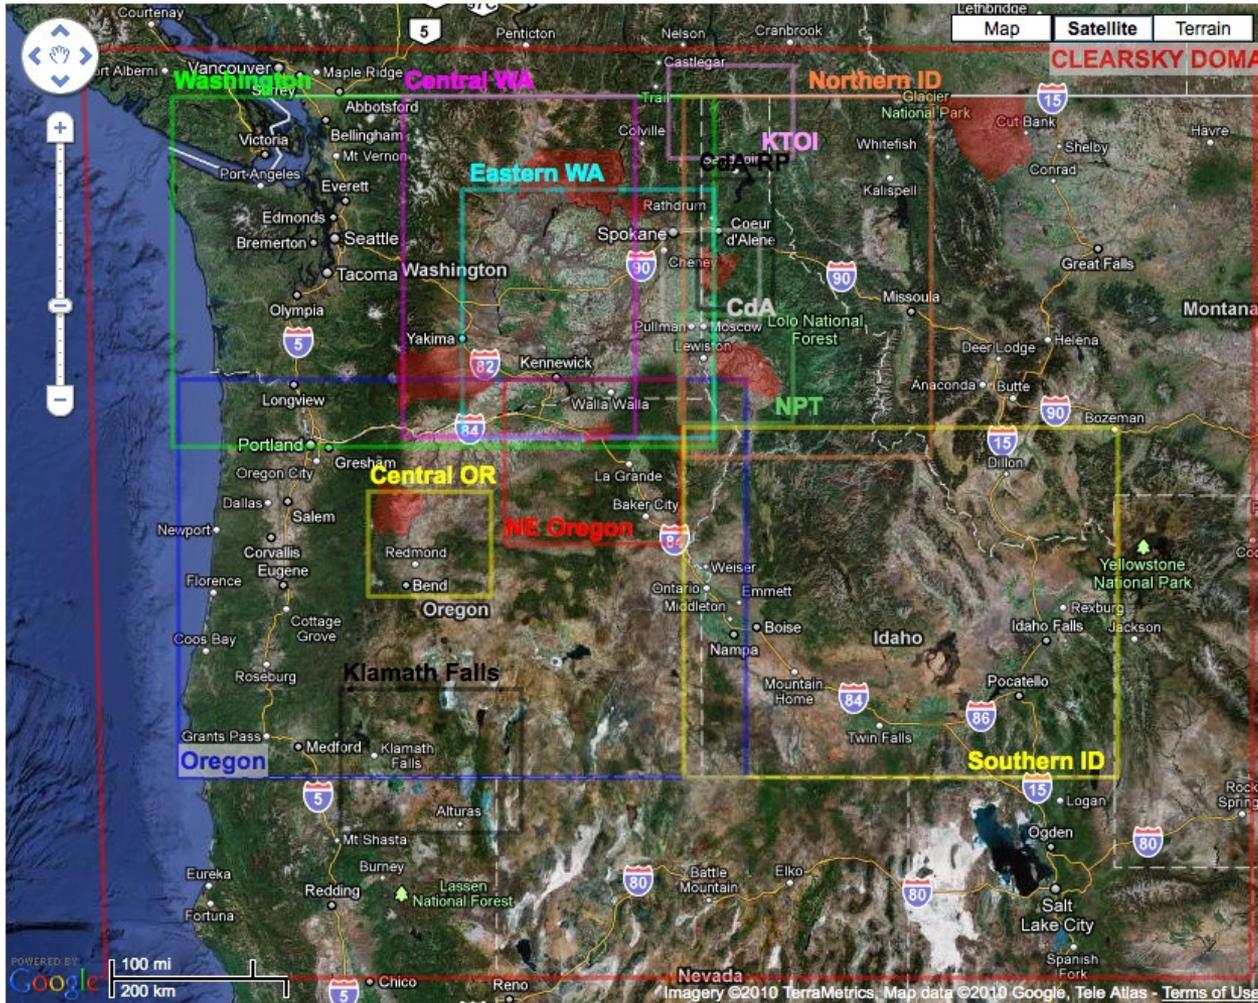

Outline

- Review of ClearSky Gaming Version
- Status of Gaming Version in Spring 2011
- How we got here...
- Current efforts
- Conclusions on ClearSky Gaming
- Big Picture on ClearSky

ClearSky Online Gaming Tool

- Daily overnight ClearSky run provides WRF-based 4-km CALMET-format meteorology.
- Gaming Tool supports rapid response field-burning plume dispersion simulations using CALPUFF.
- Uses interactive Google Map application to locate burns.
- Supports multiple burn sites per scenario.
- Results in surface layer PM_{2.5}, and optionally winds, shown as map animations on any of 14 sub-domains.

ClearSky Burn Scenario Input Form

Red-filled polygons = Tribal Lands

Toggle Subdomain Overlays

Enter information into the fields below for submittal to ClearSKY:

— STEP 1 —

Click map to get coordinates.
To remove a point, click it again.

Latitude:

Longitude:

— STEP 2 —

Field burn information.

Enter Acreage:

Field burn rate (acres/hr): (integer)

Crop Type: Wheat Bluegrass

Fuel loading (tons/acre): (integer)

Start burn: Pacific Daylight Time

Click "Enter" to see your selection in the table below. **Additional burn sites** may be added by completing Steps 1 and 2 again before continuing to Step 3.

— STEP 3 —

Specify rundate and output domain.

Select run date: (yyyymmdd)

Select output domain:

ClearSky Burn Default Results

Select scenario run date for the agency of interest: (results open in a new window)

Nez Perce Tribe:

Ecology at Eastern Regional Office, Spokane:

Oregon Department of Environmental Quality:

[ClearSKY Burn Scenario Input Form](#)

Explanation of Nez Perce Tribe burn scenarios:

Scenario	Name	Acres	Description
1	15b15c	1555	15 bluegrass fields for ~1500 acres
2	15bg1k	1041	15 bluegrass fields for ~1000 acres
3	34m23c	2296	34 mixed fields for 2296 acres
4	4bg250	253	4 bluegrass fields for 253 acres
5	8bg674	674	8 bluegrass fields for 674 acres

Explanation of Ecology at ERO burn scenarios:

Scenario	Name	Acres	Description
1	WhM12C	1200	Whitman County, Med Acres
2	WhH28C	2800	Whitman County, High Acres
3	WCM22C	2200	Walla Walla & Columbia County, Med Acres
4	WCHI4K	4000	Walla Walla & Columbia County, High Acres
5	FnG32C	3200	Franklin, Grant, Adams & Lincoln Counties

Explanation of Oregon DEQ burn scenarios:

Scenario	Name	Acres	Description
1	LGO160	160	
2	JCO160	160	

Status one year on...

In summer 2010 default scenarios were set up for cooperating groups at ECY-ERO and NPT.

In fall 2010, two new users, both in Oregon, were provided with ClearSky default scenarios:

*Imbler Fire Department and
Jefferson County Smoke management.*

Scenario counts per month are generally 200+, including defaults.

A web-page for ClearSky users to review all agencies' defaults was established.

User feedback suggests that PM_{2.5} results are too low-valued, particularly in the near-field distance, so what are we doing...?

Standard ClearSky Treatment -- How We Got Here

Emission Factors used in ClearSky were calculated from results from AIR Sciences and WSU studies.

Emission Factors are expressed in terms of fuel consumed [g PM_{2.5}/kg fuel consumed]:

Bluegrass EF_{PM25} = .0330 or 3.3% by mass,

Wheat or other crops EF_{PM25} = .0036 or 0.36%.

We adjusted plume rise parameters to get plume heights in approximate agreement with aircraft observations.

We associated Smoldering with the entire field area and treated the plume as a CALPUFF Buoyant Area Source.

We associated Flaming with a line source transecting the field and treated the plume as a CALPUFF Buoyant Line Source.

Emissions were partitioned:

20% Buoyant Area Plume and

80% Buoyant Line Plume.

But: *ClearSky wasn't constrained by comparable concentration data, due to lack of adequate PM_{2.5} measurements in vicinity of modeled burns.*

And since ClearSky began, WRF has replaced MM5.

Current modeling experiments with default scenarios

Immediate goal is to learn what treatment will give results that consistently satisfy burn managers' expectations.

In the absence of adequate PM_{2.5} data in vicinity of contemporary burns, should we be guided by the expert judgment of regional burn managers?

Treatments:

Standard: Emissions distributed between:

20% Buoyant Area Plume and
80% Buoyant Line Plume.

Test Scenarios:

A: is 99% Area

L: is 99% Line

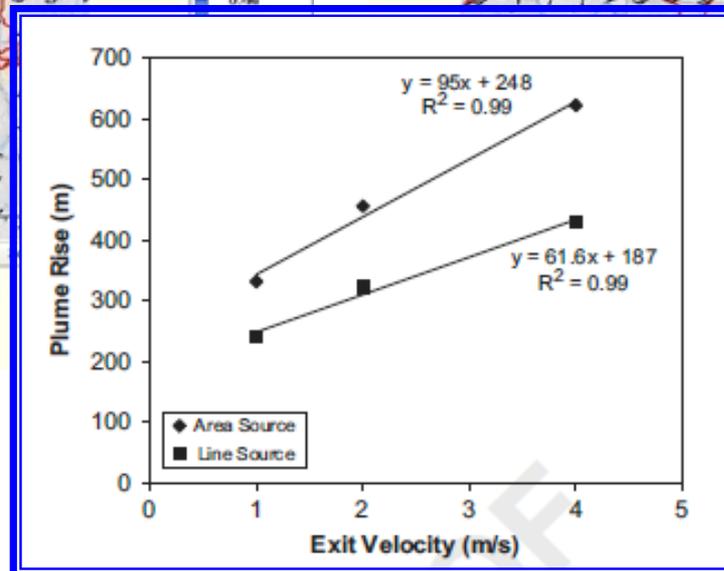

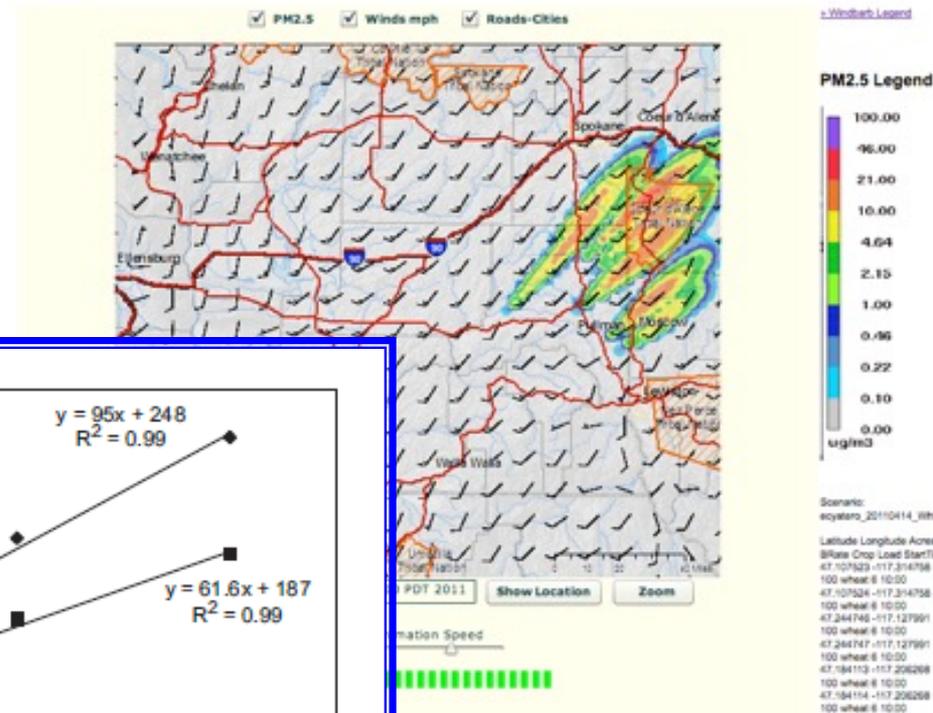

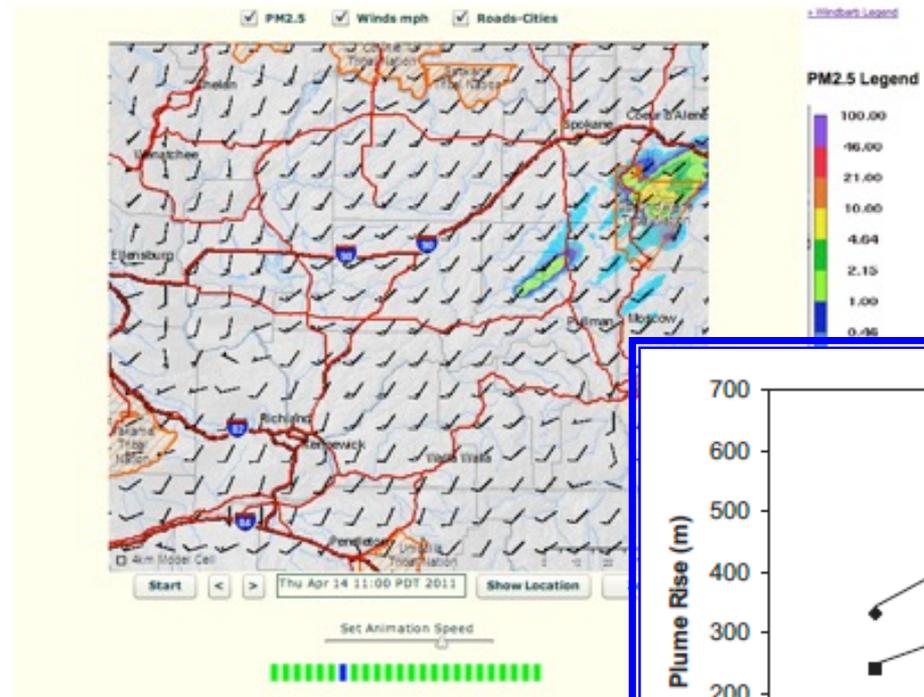

C: is 99% Area and reduced Effective Stack Radius

Longer term goal *could be* to obtain (collect?) additional downwind (near and far field) PM_{2.5} concentrations (perhaps supplemented by proxies) to guide better parameterizations in CALPUFF emissions.

Example: ECY at ERO scenario for 20110414 for 2800 acres in Whitman County Area vs. Line

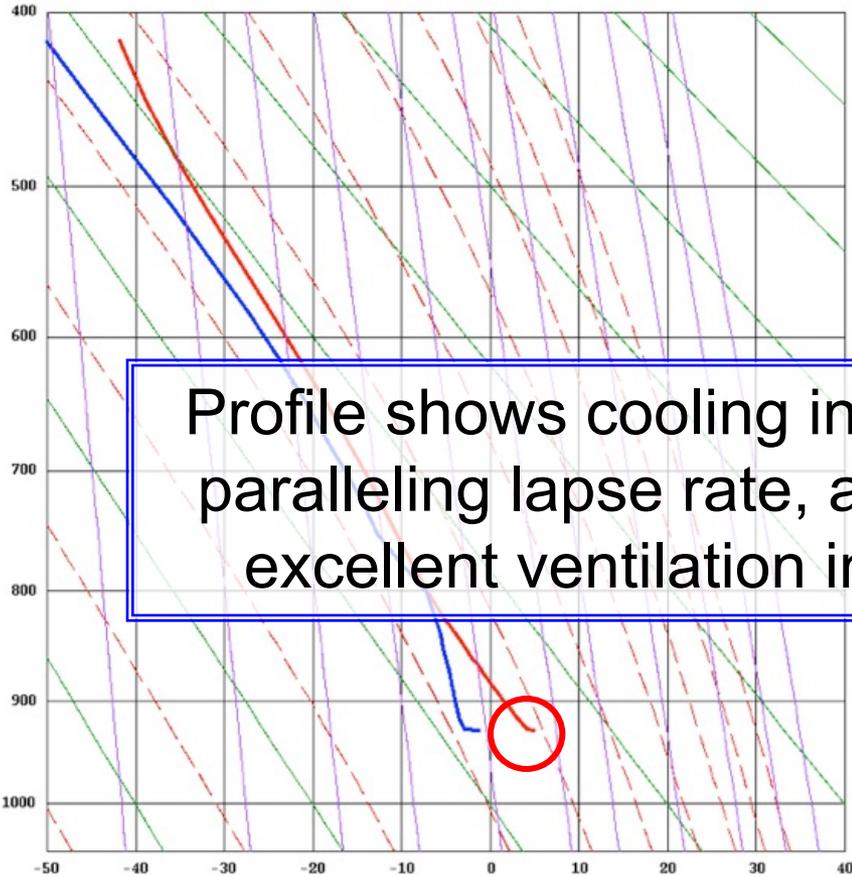

CALPUFF-modeled PM2.5 for the Eastern Washington State Area of the NW-AIRQUEST ClearSky Project
4-km Domain

Ventilation Index (m^2/s)
20m Horizontal Wind (full barb = 10kts)

Profile shows cooling in lowest layer and then paralleling lapse rate, and VI and BVVI show excellent ventilation in Whitman Cty area.

100 200 300 400 500 600 700 800 900 1000 m
Model Info: V3.1.1 KF YSU PBL Thompsons Ther-Diff 18 km, 37 levels, 72 sec
EM: 8KVM SF: Dudhia DDT: simple IM: 2D Smagor

Observations on these 20110414 modeling results

Line source treatment *kept more smoke on the ground* than did Area source treatment in near field.

Area treatment *smoke touched back down*.

Both ventilation indices showing 'excellent', and locally unstable profile also, suggests excellent dispersion. CALPUFF kept or put smoke on the ground in near and medium distance field, but we need 3-d views of plume to see how dispersed the plume was under these conditions.

Wind speeds perhaps kept Line smoke mixed down, despite VI and BVVI?

So, current effort is to review ClearSky results and in consultation with regional smoke managers, compare these results with expectations, looking for insight into why ClearSky misses expectations, in what circumstances.

Ability to dump CALPUFF results for elevated discrete receptors

NON-GRIDDED (DISCRETE) RECEPTOR DATA

Receptor No.	X LCC Coordinate (km)	Y LCC Coordinate (km)	Ground Elevation (m)	Height Above Ground (m)
1 ! X =	32.0000,	184.000,	866.000,	100.000! !END!
2 ! X =	32.0000,	184.000,	866.000,	200.000! !END!
3 ! X =	32.0000,	184.000,	866.000,	300.000! !END!
4 ! X =	32.0000,	184.000,	866.000,	400.000! !END!

Sharing results w/ public

- Someone wondered about value of sharing ClearSky with the public...?
- Convened a conference call May 11 and discussed pros and cons.
- Consensus: sharing access to the tool is not wise, but agency managers could selectively share specific results, as forwarded links, with interested (responsible?) individuals.
- We will add clear disclaimer language to website and investigate other security.

Conclusions

ClearSky can, with tuning to users expectations, become a more reliably useful tool.

But...

Ultimately, robust PM_{2.5} (and analogues) concentration data is needed to allow ClearSky to fulfill its potential of providing quantitatively meaningful results.

Therefore...

Resources should be found to conduct the necessary studies (perhaps including orchard pile burning).

Big Picture on ClearSky?

Provides additional guidance on threat zones for smoke, although it may not be 'conservative' enough.

Gaming version allows users to generate results rapidly.

FETS-ClearSky prototype offers possibility of means to generate daily agricultural burning smoke load for region, either retrospectively, or in NRT for AIRPACT ICON.

Orchard Burning burn piles may be better subject for modeling than highly variable ag field burning.
